

Faster results – in the field

Enigma Diagnostics is taking PCR-based testing out of the laboratory and into the field. Enigma ensures that infectious agents such as viruses and bacteria are detected at a time and place where the result can deliver immediate assurance or define critical action.

Enigma's portable fully automated system has the accuracy and sensitivity of laboratory based instruments and, combining all test procedures in an integrated package, provides a highly specific result from raw sample in less than 20 minutes. Add in ambient reagent storage, and Enigma Diagnostics meets the need for diagnostic systems that are portable and readily deployable with minimal operator training and expertise.

With a pipeline of platform technologies representing the next generation of integrated PCR products, Enigma is rapidly turning point of care and in-field molecular testing from concept to reality.
